Thanks @olivepossum ! I'm jumping back into Signals now and using this pipeline as my home base. I'm used to programming in R so I'm still getting my bearings with Python, my apologies for this surely noob-ish question. I did a private clone of the repo, specified my properties JSON file, and ran it, with a big block of errors I am unsure if I am reading correctly. I won't have time to run the downloading again until next week, but wanted to see if my guesses are anywhere near correct. Googling about the errors that came up, I think I may want to use a prepended 'r' instead of 'f' in folders.py (see line 30 folders.py for example).

The downloader appears to be working as intended but did not succeed in writing the data files.

Here's a pastebin of my console output.

Also I'd be glad to contribute to the project after I get my bearings if I come up with anything useful!

Thanks.
