I would like to propose that Uniswap consider supporting the integration of the TON (The Open Network) blockchain into its platform. As many of you are aware, TON is a rapidly growing blockchain that was originally developed by the Telegram team and has since evolved into a highly scalable and efficient network with a vibrant ecosystem.

Why TON?

Expanding the Uniswap Ecosystem

: By supporting TON, Uniswap could tap into a new and growing user base that is already active on the TON network. This could lead to increased liquidity, more diverse trading pairs, and greater overall utility for Uniswap. This could greatly benefit Uniswap users, especially as DeFi continues to grow in popularity and transaction volumes increase.

Community Synergy

: The TON community is known for its strong developer base and active participation. By supporting TON, Uniswap could foster new collaborations and innovations within the DeFi space.

I would like to hear the your thoughts on this proposal.
