Tuple expressions

A tuple expression constructs [tuple](#) values. The syntax for tuple expressions is a parenthesized, comma separated list of expressions. 1-ary tuple expressions require a comma after their tuple initializer operand to be disambiguated with a parenthetical expression.

Tuple expressions without any tuple initializer operands produce the unit tuple value.

Examples:

Expression Type () () (1_u32,) (u32,) (1_u32, Option::Some(3_u8)) (u32, Option) (True, False, 'abc') (bool, bool, felt252)
