Hi all, I'd like to invite the technically experienced part of the community to discuss a problem I voiced to the DeBank team.

I've made some suggestions for integrating different types of Dymension transactions into DeBank EVM portfolio and Rabby EVM wallet. The dev team sent me the following response:

"We have only integrated the EVM chain, and the staking function is on the Native chain (like Cosmos), so we cannot obtain the results and cannot integrate it."

After discussing my idea again with the dev team, they confirmed that they can't read transaction type information from Dymension EVM explorer, so they can't display tokens that are delegated to the validator and passed to staking, and they can't display transactions with different types, including stake, gov vote re-delegate etc.

The Dymension team in the discord also confirmed the existence of this kind of difficulty in transferring information to the EVM chain. One of the moderators suggested me to create a topic on the forum, and here I am.

I'd like to thank Yishay for participating in the discord discussion and hope to hear your ideas. Perhaps discussing this problem here will help find a solution and thus integrate Dymension (and possibly future rollapps) into the EVM infrastructure, thus opening up huge new opportunities (including financial) for this blockchain.
