base64.decode

Decode a field to base64.

Description

The processor will decode the value of the target field from base64 and store the result in the target field. It is not allowed to decode the.Position field.

Examples

Decode a base64 encoded string

This example decodes the base64 encoded string stored in.Payload.After . Note that the result is a string, so if you want to further process the result (e.g. parse the string as JSON), you need to chain other processors (e.g.json.decode).
