Hi UNIs,

I do not have a formal proposal idea, but I will make my best here to present my "concept".

THE ISSUE

I foresee liquidity in Uniswap dropping once the genesis pools for UNI farming dry out Nov 17.

My opinion is that the total value locked (TVL) size of a DEX is what distinguishes DEX "status" among themselves.

So having this in mind, How do we keep liquidity providers in Uniswap without much UNI inflation?

THE "PROPOSAL"

Every week \ day \ x-period of time, pick randomly (by smartcontract) among x-amount of addresses who are providing liquidity in the top x-number of pools and reward them with a fair amount of UNI. The amount to award per x-period of time can be set to a satisfactory inflation ratio of the UNI governance.

I think this distribution is fair for small and big liquidity providers, and keeps the liquidity providers interested; sort of a lottery ticket.

That is the extent of my proposal concept.

Please agree, disagree, make comments and perhaps if there is interest there can be more details further developed, discussed.

**There would have to be a way (via smartcontract) to avoid people or bots from creating multiple addresses with low liquidity; but those are details. People always find ways to break things. However, I believe the ISSUE is real, and I hope I made the overall concept clear. Judge the concept.
