Built a quick tool for delegation/re-delegation which others may find useful. [You can find it here](#).

This tool tries to answer two needs:

- Promote decentralization by automating delegation to multiple parties

- Automate re-delegation of staking rewards (to compound your earnings)

It's extremely simple and has been tested on a Mac + secretcli + Ledger Nano S. I expect it will either work as is for similar deployments, or may require minor changes (please create PRs if you notice this!).

This tool is extremely experimental and hasn't been thoroughly tested, so use at your own risk!
