I've tested and modified the code since I've done this video, but the idea is still the same.

Tokens are deposited into the contract, used to vote on oracle configurations (Fees, punishments and such) and also used to back different watchers (oracle verifiers)

1. A request ticket is filed (query string, data type, "is it subjective?" boolean)

2. Watchers commit a secret vote

3. Watchers reveal their vote

4. If the request ticket is subjective, watchers go through a "attacking phase" for outliers

5. In finalize request ticket votes are counted up and rewards distributed.

Pastebin

Oracle.sol - Pastebin.com

Pastebin.com is the number one paste tool since 2002. Pastebin is a website where you can store text online for a set period of time.
