Hello everyone,

This proposal as for goal to introduce a new category of assets to Aave: Uniswap v3 NFTs.

The time for DeFi protocols interoperability has come.

Since Uniswap v3 NFTs represents a position made of 2 assets in a liquidity pool, why not use them as collateral ? Of course, this would be limited to Aave-approved-tokens Uniswap v3 pools, such as ETH / DAI, WBTC / ETH etc.

This would allow users to borrow an asset against 2 assets with the collateral adjusted dynamically. Thus, users would be able to manage their positions in an easier manner, while still beeing exposed to a Uniswap v3 position.

Liquidators could also profit from this proposal, by liquidating Uniswap v3 NFTs, they would get extra tokens via the fees generated by the Uniswap position.

I will be happy to read your toughts on the subject
