If I understand Secret chain, use of SCRT on the chain -IS- visible on the public blockchain, however use of (encrypted) sSCRT or s[token] is -NOT- visible on the blockchain.

I've found solutions like blackbox.cash, which has some very useful Smart Contracts.

So if I have a "private" wallet on Secret, funded w enough SCRT for gas & I send sUSDC to another Secret wallet of mine, will the source & destination wallet be visible on the blockchain? I know Blackbox's Deadrop can solve this, which is why I thought it might be a problem.
