Hi…I am not technical but I am interested in the potential of Aztec in privacy focused blockchain applications. Since most of the questions here are quite technical, I am quite happy for this post to be deleted but I thought I would ask a couple of basic questions…

At the moment it appears from the roadmap that Aztec is building out its core functionality on TestNet. Can someone explain the roadmap towards a full Mainnet implementation? Dates, steps etc.

What is the best introduction (on YouTube perhaps) to the main concepts of Aztec, ZK SNARKS, rollup etc. that would provide me a better understanding of the capabilities of the platform in terms of building real-world applications?

I am based in London and interested in building apps for the financial services industry. Would anyone be interested in discussing some of the more basic elements of Aztec in order to explore possible applications?

Thanks for reading
