Hello all, today I did read something on Strangelove's interchain query (ICQ) module and the Twitter thread of Neutron (https://twitter.com/Neutron_org/status/1564962355674435584).

The thread is focused on the possible advantages of Strangelove's ICQ module over other ICQ methods. Some of them as follows:

- No need to know the exact location of the data,
- Light clients can check validity.

So it is an ICQ module that is easier to use and also trust-minimized.

At the end of the thread, they mention the fact that Osmosis and Juno have signaled their interest in implementing the module.

I wonder if Secret Network has such an intention?
