Hello!

I just heard about Aztec on a podcast and was really excited about the privacy aspect and wanted to test it out locally!

I seem to be running into an issue with I run the cli to install Aztec locally. It seems to get hung up on this part:

The node version I'm using is 18 and I have Docker and Docker Compose installed on my machine globally.

Would love help trying to solve this so I can get to playing around on the network.
