I am not to Catalyst. Trying to install using instructions at https://enigma.co/catalyst/install.html.

Platform: Ubuntu 18.04.2 LTS

I have tried both Acaconda & MiniConda installs which don't complete.

The troubleshooting steps are ok until command "pip install enigma-catalyst matplotlib"

Looks like main error is "Could not find local HDF5 installation".

I have not found anything on Google to fix HDF5 issue.

1. Am I using the appropriate plateform? I saw other posts referencing "Docker" which I thought was for Windows installations.

2. When adding packages I get upgraded to python 3.7.2. Should I try to keep envirionment at python 3.6? Not sure how that would be possible when installing required files.
