# oSnap Configuration Parameters

Overview of oSnap Configuration Parameters The parameters below are independent parameters on the oSnap module that can be updated after deployment in the SAFE advanced settings.

- Collateral:
- The ERC20 token used for the bond. The options are USDC and WETH.
- Bond:
- The bond value is the amount proposers (and disputers) are required to post in the collateral currency. The minimum recommended bond values are 1,500 USDC and 1 WETH.
- Liveness:
- The length of time a proposal can be disputed. The minimum recommended liveness period is 6 hours to allow disputers to verify a proposal follows the rules.
-

The parameters below are defined within a single 'rules' string on oSnap modules that follow recommended settings. The 'rules' string can be updated after deployment.

- Voting Quorum:
- The minimum number of vote participation required for a valid proposal. For example, the proposal should not be considered valid if the voting quorum parameter is 50% and the proposal only had 30% voter participation. This is inherited from Snapshot.
- Voting Period:
- The minimum voting period that should be set in the Snapshot proposal. Any voting period set for a proposal that is less than the parameter set in the rules will not be considered a valid proposal.
- Challenge Period:
- The challenge period, also referred to as the liveness period, is the challenge window where disputers can dispute a proposal, and is another knob you can turn to increase security (while accepting UX trade-offs). You can find your oSnap configuration parameters in the advanced settings, by navigating to the oSnap SAFE App. Click on the gears.
-

?

The configuration parameters will be displayed in the fields below.Please adjust with caution.
