Hi community, I've been trying to find the answer to the below question on the ethereum forums, but haven't found so I write this post.

Currently, I am looking for the SHA3-256 (SHA3 FIPS 202,https://en.wikipedia.org/wiki/SHA-3) hash function on the solidity to develop a new smart contract using this hash function. But, I haven't found any related information regarding SHA3-256 on the solidity.

1.) SHA3-256 hash function exists on the solidity?

2.) If not, is there any plan to implement the SHA3-256 hash function on the solidity as a method?

3.) If not, anything I can do to use the SHA3-256 has function on the solidity?

It would be really helpful if you know the answer to the above questions. Thank you for reading this question.
