Subscription methods

Subscription methods are available for [WebSocket](#) connections only, and allow you to wait for events instead of polling for them. For example, dapps can subscribe to logs and receive notifications when a specific event occurs.

The following subscription methods are available:

- [eth_subscribe](#)
-
    - Create a subscription to a particular event
- [eth_unsubscribe](#)
-
    - Cancel an active subscription

info We recommend you use the WSS protocol to set up bidirectional stateful subscriptions. Stateless HTTP WebSockets are also supported.
