AA15 initCode must create sender

The smart account deployment process with the initCode does not return any sender address. There are two possible reasons:

- The initCode
- factory is not creating an account.
- The initCode
- factory is creating an account, but is not implemented correctly as it is not returning the deployed sender
- address.

Possible solutions

- Verify that the factory address in the initCode
- is correct (the factory address is the first 20 bytes of the initCode
-).
- Verify that the initCode
- factory is implemented correctly. The factory must deploy the smart account and return the deployed sender
- address.
- If all else fails, investigate why the initCode
- factory does not return a sender
- address using tools like [Tenderly](#)
- .
