Hi all,

We just hacked a proof of concept tool for finding addresses that are being referenced by a smart contracthttps://showme-1389.appspot.com/

It uses API from the eveem.org symbolic decompiler to figure out stuff like this:

[

15

1944×1182 342 KB

](https://ethresear.ch/uploads/default/original/2X/3/3cd3153dcf48ef88bc796abc85ddff023400689c.png)

If anyone's interested in how it's done, you can check the github for sources, and also the intermediate language form that is the basis for the analysis, available here:

http://eveem.org/code/0x06012c8cf97bead5deae237070f9587f8e7a266d.json
