AA24 signature error

The validateUserOp function of the smart account rejected the signature of the user operation.

Possible solutions

- Verify that the user operation was correctly signed, and that the signature was correctly encoded in the signature
- field of the user operation.* Most smart account implementations sign over the userOpHash
  - . Make sure that the userOpHash
  - is correctly computed. Consider leveraging functions like getUserOperationHash
  - .
  - Make sure you have selected the correct chainId
  - and entryPointAddress
  - when computing the userOpHash
  - .
  - Make sure the smart account signature verification function is correctly implemented.
- If all else fails, investigate why the validateUserOp
- function rejected the user operation signature using tools like Tenderly
- .
