Hi all,

I'm excited about this new set-up!

At EthCC and Nebular (2023), I talked to several people about privacy. I realized that one important aspect of privacy is often overlooked: meta-data privacy. Even if you use ZKPs or content-hiding tooling, exposing meta-data on the network level can enable various attacks and violates privacy according to many definitions in [1]. Therefore, my main question for now is: Is network layer privacy a priority for Anoma?

If yes, I want to spend some time on this and talk to people from other projects for potential collaboration (e.g., NYM [2]).

[1] Pfitzmann, A., & Hansen, M. (2010). A terminology for talking about privacy by data minimization: Anonymity, unlinkability, undetectability, unobservability, pseudonymity, and identity management.
