Hi all, I've gotten several different error messages while running discovery test

and I was hoping to get an explanation of what they meant:

1. "Wrong epoch for this task" was thrown, throw an Error

2. Incorrect nonce yielding bad secret contract address

3. "Allowance not enough" was thrown, throw an Error

What's particularly frustrating about this set of messages is that they seem to get thrown at random. I'll run the same discovery test

multiple times and each time a different message will appear, with no changes in the code and seemingly no pattern in which messages comes up.

Does anyone have any insight into these errors?
