On here https://build.scrt.network/ledger-nano-s.html#common-commands

you have listed some secret-cli commands to send, delegate, withdraw rewards.

Can you also add the command to re-invest (re-delegate) the rewards directly without withdrawing first?

i.e. the equivalent of the Reinvest function Mathwallet had (now they removed it).

The Mathwallet Dapp is buggy and has even the Withdraw function broken now, so i am seriously considering to switch to secret-cli.
